

Lift & Shift Feasibility Assessment

Accelerate in cloud adoption with an approach that works

Moving resources from the on-premise datacenter to the Azure environment is not something you do overnight. This needs a proper planning and an approach to detail the workloads before they are re-hosted in the new environment.

We assist our customers throughout the entire migration process with an approach that works. Below you have a brief overview of the different steps and their goals.

Information Gathering

Centralize all existing application information, gather business requirements and implement Azure Migrate for technical scanning for information.

Analysis

Analysis of the application information. Details application characteristics and review business requirements of customer application landscape.

Assessment

The feasibility assessment is the development phase for creating application lift-and-shift guidance and categorization. Based on these definitions an overview of the planning can be created as initial project plan for the execution.

Phase 0 Execution

This is the execution phase where the definitions and procedures are executed. During this phase these definitions are challenges and evaluated against all the applications that are defined in scope for the migration.

Plan your jumpstart Lift & Shift Assessment workshop today. Send a request to solutions@itnetx.be and start your cloud journey with itnetX experts.

Customer Opportunity

- Guided assessment of your application landscape.
- Accelerate in cloud adoption.
- Drive innovation.
- Expert training for your system engineers.
- A team of experts at your service

Our promise to you...

Share our expertise and help with your cloud journey is our mission. Being a partner that accelerates its customers and creates business value for your organization is in our DNA.
